## Professional Summary

Software Engineer with mid-level experience delivering player-behavior telemetry and analytics solutions for live games. Designed and deployed analytics pipelines and dashboards that cut bug investigation time by 70% and boosted team productivity by 80%. Proficient in SQL, Python, A/B testing, and data visualization, turning complex data into actionable insights for product and design teams. Seeking to apply analytics expertise to drive data-informed decisions and improve player experience in a live-service environment.

## Skills

**Data & Analytics:** SQL, Excel, Python (Pandas, NumPy, Plotly), ETL, Data Cleaning
**Visualization:** KPI Dashboards, Data Storytelling, Time-Series Forecasting
**Tools:** GitHub, Jira, Confluence, Postman, Unreal Engine, Unity3D, Perforce
**Programming:** C++, TypeScript, C#, React

## Work Experience

**Software Engineer** | Shrapnel — Feb 2024 to Sept 2024 | Seattle WA USA

- Designed and deployed a player-behaviour telemetry system from zero, establishing the data foundation for all product analytics across 7 live early-access releases, directly equivalent to lifecycle analytics in a live service environment.
- Defined and maintained core player KPIs: retention, session length, engagement funnels, and progression milestones, used to guide product roadmap decisions across studios.
- Built an internal analytics dashboard adopted by product, design, and QA teams, cutting bug investigation time by 70% and accelerating the data-to-decision feedback loop.
- Partnered with gameplay, backend, and design teams to translate raw event logs into aggregated views, enabling non-technical stakeholders to self-serve on live product data.
- Tech stack: C++, Unreal Engine 5.3, TypeScript, React, MongoDB, Perforce.

**Tools Engineer** | Shrapnel — Aug 2023 to Feb 2024 | Seattle WA USA

- Shipped a React + TypeScript content moderation tool that compressed a multi-step review process into a 2-step workflow, reducing time-to-decision on live content changes.
- Resolved a critical crash-causing bug that improved tool stability by 30%, protecting data capture integrity and reducing invalid events in downstream analytics pipelines.
- Conducted UX research with designers, artists, and power users through interviews and usability tests, then translated the feedback into prioritized feature improvements that boosted user satisfaction and were shipped iteratively.
- Owned client-side tool development within a 3-person team, enabling backend engineers to focus on server-side data work.

## Projects

**Product Sales & Demand Forecasting Dashboard** — June 2026

- Developed an ETL pipeline in Python to consolidate and clean data from 50+ Excel files and 3,600+ product records.
- Performed data cleansing and validation to resolve schema changes, naming inconsistencies, and inventory anomalies.
- Created interactive dashboards using Streamlit and Plotly for sales, inventory, and demand analysis.
- Built and evaluated demand forecasting models using Holt-Winters and statistical forecasting techniques.
- Generated inventory optimization metrics including stockout alerts, safety stock, and reorder points.
- Deployed the application as a standalone executable for non-technical end users.

## Education

**M.S. Computer Science** - DigiPen Institute of Technology, Redmond, WA, USA

**B.E. Information Technology** - Thadomal Shahani Engineering College, Mumbai, MH, India

## Certifications

**Data Visualization and Dashboards** - IBM - 2026

**Databases & SQL for Data Science with Python** - IBM - 2026
